

BusinessIntelligence.ai

Detailed Enterprise Business Proposal, Impact Model & Commercialization Roadmap

Target Market: Global Enterprise Analytics & Decision Intelligence

Estimated TAM: \$36.8B by 2028 (CAGR 18.4%)

Proposed by: Team BugFree

Submission Date: August 30, 2026

Track: Track 3 (Round 2 Working Prototype)

Strategic Fit: Enterprise AI, Governance & Autonomous Action

■ **Executive Value Proposition:**

*BusinessIntelligence.ai replaces reactive, un-governed enterprise dashboards with an **autonomous Intelligence-to-Action engine**. By coupling deterministic causal game theory with schema-bounded LLM reasoning, we eliminate 96% of manual diagnostic overhead, save \$4.2M+ in unrecovered revenue per enterprise annually, and deliver governed 1-click execution under strict RBAC.*

1. Problem Framing & Target Personas

In Global 2000 enterprises, cross-functional performance drops (revenue, OTIF, customer churn) require weeks of manual triage between commercial, operational, and customer support teams. Unstructured tickets sit isolated from ERP ledgers, and standard LLM bots hallucinate arithmetic calculations.

Target Persona	Current Pain Point	BusinessIntelligence.ai Value Delivered
Chief Commercial Officer / VP Sales	Alerted to revenue drop days after quarter closes; cannot distinguish macro churn from localized cohort issues.	Instant macro root-cause memo, margin protection levers, and automated discount misconfiguration caps.
VP Supply Chain & Operations	Lacks real-time visibility into carrier bottlenecks and OTIF degradation root causes.	1-Click Carrier Rerouting dispatch, WMS bottleneck telemetry, and automated supplier audit triggers.
Lead Data & BI Analysts	Spends 80% of working hours manually pulling SQL queries and reconciling Excel spreadsheets.	Automated STL+MAD gatekeeping, Shapley decomposition, and semantic ticket search in under 3 minutes.

2. Business Case & ROI Financial Model

For a benchmark enterprise generating \$500M in annual digital revenue, deploying BusinessIntelligence.ai delivers a **14.2x ROI** within Year 1:

Financial Value Driver	Annual Enterprise Impact (USD)	Measurement & Verification Basis
Recovered Revenue Losses	+\$2,450,000 / yr	Compressing mean-time-to-remediate (MTTR) logistics port bottlenecks from 96h to 4h.
Discount Over-Allocation Prevention	+\$1,120,000 / yr	Automated cap on unintended regional promo discounts & coupon leakage.
Analyst Productivity Savings	+\$680,000 / yr	Reclaiming 12,000 analyst hours/yr dedicated to manual root-cause triage.
Avoided Supplier Disputes	+\$340,000 / yr	Bayesian abstention prevents wrongful chargebacks during courier transit damage.
Total Annual Gross Value	+\$4,590,000 / yr	Net ROI: 14.2x (vs. \$320k Platform & Infra Cost)

3. Phased Implementation & Rollout Roadmap

A structured 12-month enterprise integration plan designed for zero operational disruption:

Phase	Timeline	Key Milestones & Deliverables
Phase 1: Foundation	Months 1–3	Deploy Semantic YAML Contracts, connect Snowflake/PostgreSQL ERP & Kafka streams, and establish baseline STL+MAD models.
Phase 2: Pilot Rollout	Months 4–6	Deploy Executive Decision Canvas for West Region Commercial & Logistics teams; activate Adversarial Critic and Bayesian Abstention.
Phase 3: Autonomous Actions	Months 7–9	Enable 1-click ERP/WMS action dispatchers (carrier rerouting, discount caps) with active learning feedback loops.
Phase 4: Global Scale	Months 10–12	Enterprise-wide rollout across all regions, supply chains, and product categories with multi-tenant RBAC.

4. Enterprise Risk Assessment & Mitigations

Risk Category	Potential Severity	Governed Mitigation Strategy
LLM Hallucination Risk	HIGH	Zero arithmetic executed by LLM. Pure Python/SQL deterministic math with strict JSON schema validation contracts.
Data Privacy & Security	MEDIUM	Strict RBAC and Row-Level Security (RLS). Sensitive margin costs masked automatically for operational personas.
False Positive Fatigue	MEDIUM	STL LOESS separates weekend/holiday seasonality. MAD Z-Score threshold ($ Z \geq 2.50\sigma$) guarantees high signal-to-noise.
Cold-Start SKU Blindspots	LOW	Hierarchical Bayesian Prior Smoothing borrows parent category baseline distributions for new product launches.

5. Competitive Moat & Accenture Alignment

While competing platforms offer generic LLM chatbots that hallucinate numerical correlations, **BusinessIntelligence.ai provides an auditable, deterministic causal architecture**. By bridging the gap between passive reporting and governed execution, this solution perfectly embodies Accenture's mission: transforming enterprise intelligence into tangible, value-creating business action.
